

Michael Tamm | MOTOR-TALK GmbH

Cleverly Testing Webapplications With WebDriver

Who am I?

Michael Tamm

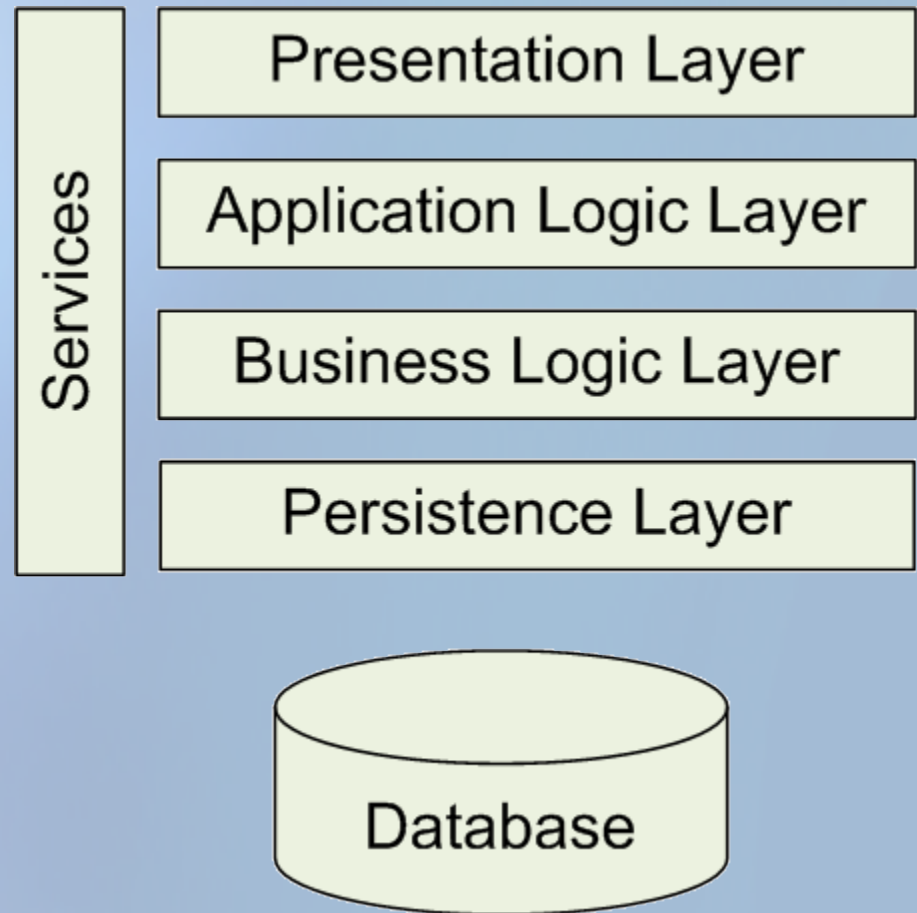

till 1999	Dipl.-Ing. (BA) Computer Science
till 2007	Programmer & System Architect at aperto AG
currently	System Architect at MOTOR-TALK GmbH
furthermore	Writer for c't and iX , JAX -Speaker

Agenda

- Some General Thoughts About Frontend Tests
- WebDriver Concepts & API
- Getting Started
- Examples for Simple Tests
- Best Practices
- Future Prospects

Wherefore Frontend Test?

- Unit Tests
- Functional Tests
- Acceptance Tests
- System Tests

Wherefore WebDriver?

- Cactus
- HttpUnit, HtmlUnit
- Canoo WebTest
- Selenium
- Watir, Watij
- ...

Agenda

- Some General Thoughts About Frontend Tests
- [WebDriver Concepts & API](#)
- Getting Started
- Examples for Simple Tests
- Best Practices
- Future Prospects

Therefore WebDriver!

- Java-API
- Simple Java-API
- Support for
 - HtmlUnit
 - Firefox
 - Internet Explorer
 - Safari
 - ...

WebDriver API: Interface WebDriver

Method Summary	
void	close() Close the current window, quitting the browser if it's the last window currently open.
WebElement	findElement(By by) Find the first WebElement using the given method.
java.util.List< WebElement >	findElements(By by) Find all elements within the current page using the given mechanism.
void	get(java.lang.String url) Load a new web page in the current browser window.
java.lang.String	getCurrentUrl() Get a string representing the current URL that the browser is looking at.
java.lang.String	getPageSource() Get the source of the last loaded page.
java.lang.String	getTitle() The title of the current page.
boolean	getVisible() Is the browser visible or not?
WebDriver.Options	manage() Gets the Option interface
WebDriver.Navigation	navigate() An abstraction allowing the driver to access the browser's history and to navigate to a given URL.
void	quit() Quits this driver, closing every associated window.
void	setVisible(boolean visible) Make the browser visible or not.
WebDriver.TargetLocator	switchTo() Send future commands to a different frame or window.

Method Summary

void	close() Close the current window, quitting the browser if it's the last window currently open.
WebElement	findElement(By by) Find the first WebElement using the given method.
java.util.List< WebElement >	findElements(By by) Find all elements within the current page using the given mechanism.
void	get(java.lang.String url) Load a new web page in the current browser window.
java.lang.String	getCurrentUrl() Get a string representing the current URL that the browser is looking at.
java.lang.String	getPageSource() Get the source of the last loaded page.
java.lang.String	getTitle() The title of the current page.
boolean	getVisible() Is the browser visible or not?
WebDriver.Options	manage() Gets the Option interface
WebDriver.Navigation	navigate() An abstraction allowing the driver to access the browser's history and to navigate to a given URL.
void	quit() Quits this driver, closing every associated window.
void	setVisible(boolean visible) Make the browser visible or not.
WebDriver.TargetLocator	switchTo() Send future commands to a different frame or window.

WebDriver API: Class By

Method Summary	
boolean	equals (java.lang.Object o)
WebElement	findElement (WebDriver driver) Find a single element.
abstract java.util.List< WebElement >	findElements (WebDriver driver) Find many elements.
int	hashCode ()
static By	id (java.lang.String id)
static By	linkText (java.lang.String linkText)
static By	name (java.lang.String name)
static By	xpath (java.lang.String xpathExpression)

WebDriver API: Class WebElement

Method Summary	
void	clear() If this element is a text entry element, this will clear the value.
void	click() Click this element.
java.lang.String	getAttribute() (java.lang.String name) Get the value of a the given attribute of the element.
java.util.List< WebElement >	getChildrenOfType() (java.lang.String tagName) Get the list of child elements that match the given tag name.
java.lang.String	getText() Get the innerText of this element, without any leading or trailing whitespace.
java.lang.String	getValue() Get the value of the element's "value" attribute.
boolean	isEnabled() Is the element currently enabled or not?
boolean	isSelected() Determine whether or not this element is selected or not.
void	sendKeys() (java.lang.CharSequence... keysToSend) Use this method to simulate typing into an element, which may set its value.
void	setSelected() Select an element.
void	submit() If this current element is a form, or an element within a form, then this will be submitted to the remote server.
boolean	toggle() If the element is a checkbox this will toggle the elements state from selected to not selected, or from not selected to selected.

Method Summary

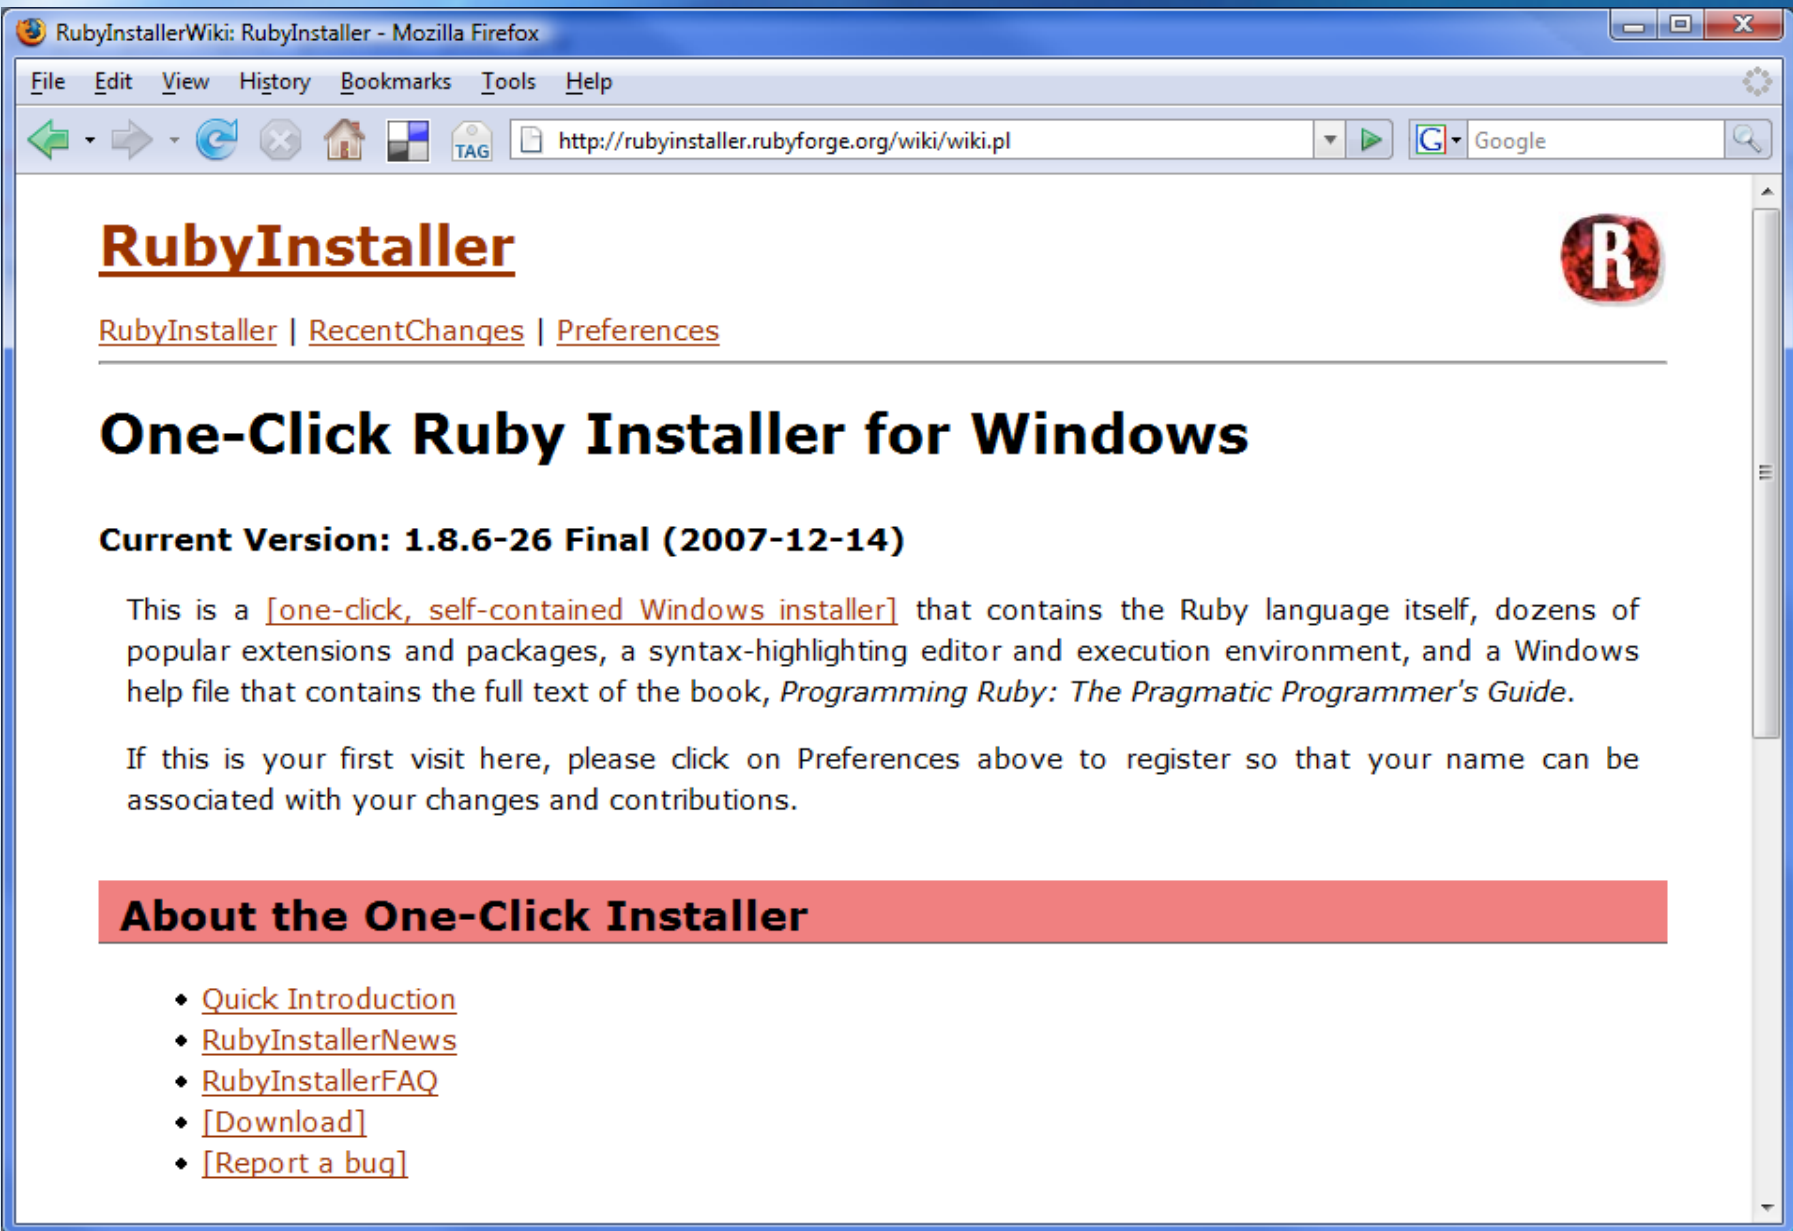

void	<u>clear()</u> If this element is a text entry element, this will clear the value.
void	<u>click()</u> Click this element.
java.lang.String	<u>getAttribute()</u> (java.lang.String name) Get the value of a the given attribute of the element.
java.util.List< <u>WebElement</u> >	<u>getChildrenOfType()</u> (java.lang.String tagName) Get the list of child elements that match the given tag name.
java.lang.String	<u>getText()</u> Get the innerText of this element, without any leading or trailing whitespace.
java.lang.String	<u>getValue()</u> Get the value of the element's "value" attribute.
boolean	<u>isEnabled()</u> Is the element currently enabled or not?
boolean	<u>isSelected()</u> Determine whether or not this element is selected or not.
void	<u>sendKeys()</u> (java.lang.CharSequence... keysToSend) Use this method to simulate typing into an element, which may set its value
void	<u>setSelected()</u> Select an element.
void	<u>submit()</u> If this current element is a form, or an element within a form, then this will be submitted to the remote server.
boolean	<u>toggle()</u> If the element is a checkbox this will toggle the elements state from selected to not selected, or from not selected to selected.

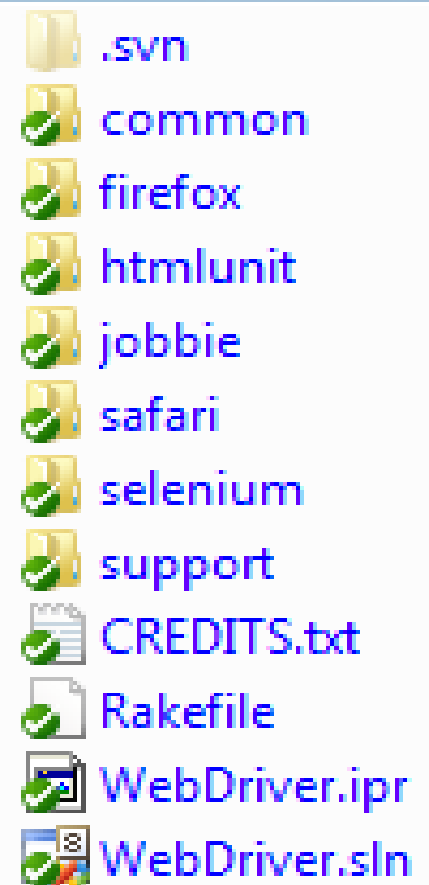

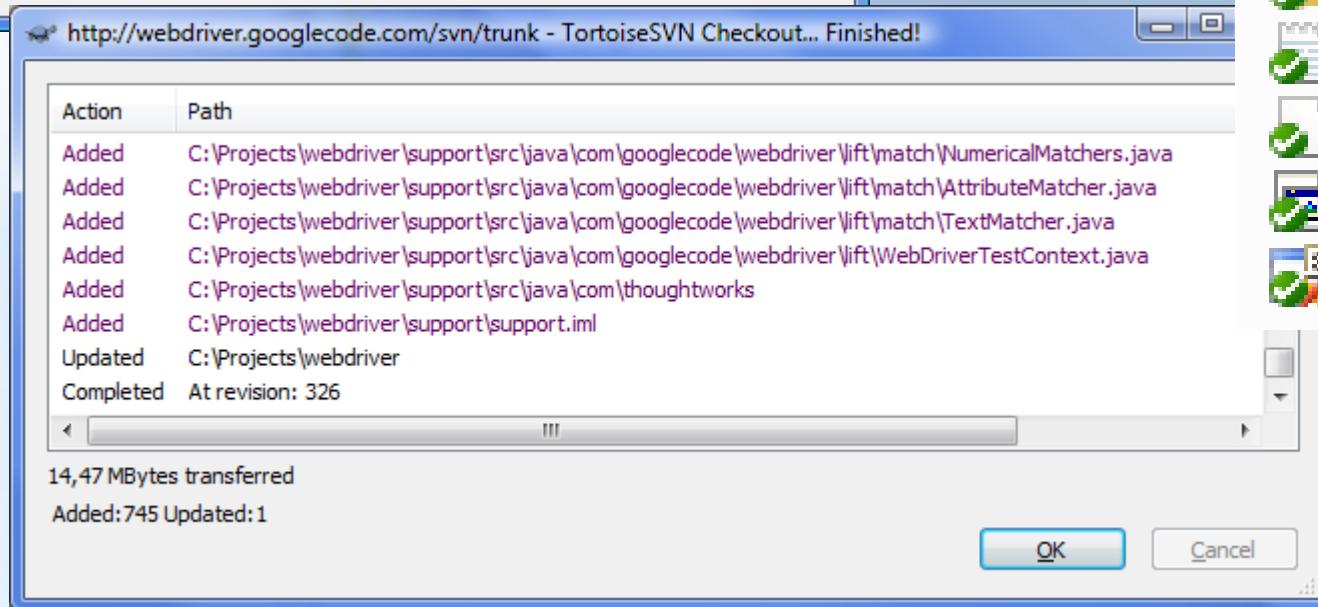

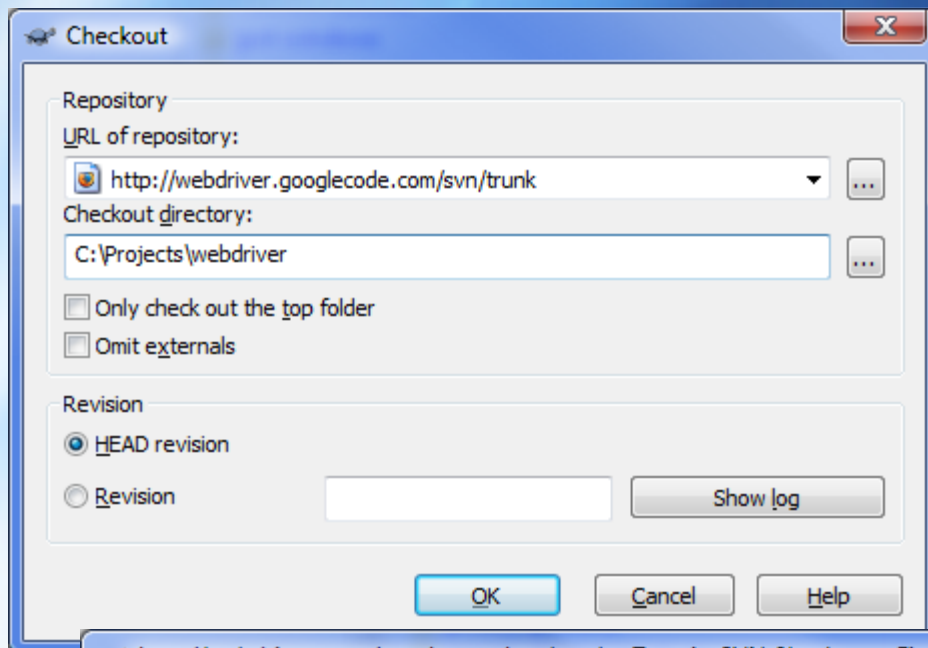

Agenda

- Some General Thoughts About Frontend Tests
- WebDriver Concepts & API
- **Getting Started**
- Examples for Simple Tests
- Best Practices
- Future Prospects

Getting Started

- install Ruby & Rake
- svn checkout / export
<http://webdriver.googlecode.com/svn/trunk>
- rake install_firefox
- rake

Visual Studio 2005 Command Prompt

Setting environment for using Microsoft Visual Studio 2005 x86 tools.

C:\Program Files\Microsoft Visual Studio 8\VC>cd C:\Projects\webdriver

C:\Projects\webdriver>rake install_firefox

(in C:/Projects/webdriver)

Building: common/build/webdriver-common.jar

Building: firefox/build/webdriver-firefox.jar

java -cp common/build/webdriver-common.jar;firefox/build/webdriver-firefox.jar;firefox/lib/runtime/js

Creating WebDriver

Profile created

Attempting to install the WebDriver extension

Updating user preferences with common, useful settings

Deleting existing extensions cache (if it already exists)

Firefox should now start and quit

C:\Projects\webdriver>"c:\Program Files\Mozilla Firefox\firefox.exe" -ProfileManager

C:\Projects\webdriver>_

Firefox - Choose User Profile

Firefox stores information about your settings, preferences, and other user items in your user profile.

Create Profile...

Rename Profile...

Agenda

- Some General Thoughts About Frontend Tests
- WebDriver Concepts & API
- Getting Started
- Examples for Simple Tests
- Best Practices
- Future Prospects

Example 1: Google Search

```
public class GoogleSearch {

    private WebDriver _driver;

    @Before
    public void setUp() {
        _driver = new FirefoxDriver();
        // _driver = new HtmlUnitDriver();
        // _driver = new InternetExplorerDriver();
    }

    @After
    public void tearDown() {
        _driver.close();
    }

    @Test
    public void searchForJaxMichaelTamm() {
        _driver.get("http://www.google.com/ncr");
        _driver.findElement(By.name("q")).sendKeys("Jax Michael Tamm");
        _driver.findElement(By.xpath("//input[@type = 'submit' and @value = 'Google Search']")).click();
        WebElement body = _driver.findElement(By.xpath("/html/body"));
        assertThat(body.getText(), containsString("JAX 2008"));
    }
}
```

Example 2: Google Suggest

```
@Test
public void googleSuggest() throws InterruptedException {
    _driver.get("http://www.google.com/webhp?complete=1&hl=en");
    _driver.findElement(By.name("q")).sendKeys("jav");
    // Give Google Suggest some time to load suggestions ...
    Thread.sleep(500);
    WebElement firstSuggestion =
        _driver.findElement(By.xpath("//table[@id = 'completeTable']/td"));
    assertThat(firstSuggestion.getText(), is("java"));
    firstSuggestion.click();
    assertThat(_driver.getTitle(), is("java - Google Search"));
    WebElement linkToJavaHomepage =
        _driver.findElement(By.linkText("java.com: Hot Games, Cool Apps"));
    linkToJavaHomepage.click();
    assertTrue(_driver.getCurrentUrl().startsWith("http://www.java.com/"));
}
```

Agenda

- Some General Thoughts About Frontend Tests
- WebDriver Concepts & API
- Getting Started
- Examples for Simple Tests
- **Best Practices**
- Future Prospects

Best Practice

- **Jeffrey Fredrick:** „The sooner you learn about a problem the cheaper it is to fix, ...“
- Set up a Continuous Integration Server!
- Organize your tests and run fast tests first!

Example 1: TeamCity

Projects -- TeamCity - Mozilla Firefox

Example 2: Maven

Default Lifecycle

validate	validate the project is correct and all necessary information is available.
generate-sources	generate any source code for inclusion in compilation.
process-sources	process the source code, for example to filter any values.
generate-resources	generate resources for inclusion in the package.
process-resources	copy and process the resources into the destination directory, ready for packaging.
compile	compile the source code of the project.
process-classes	post-process the generated files from compilation, for example to do bytecode enhancement on Java classes.
generate-test-sources	generate any test source code for inclusion in compilation.
process-test-sources	process the test source code, for example to filter any values.
generate-test-resources	create resources for testing.
process-test-resources	copy and process the resources into the test destination directory.
test-compile	compile the test source code into the test destination directory
process-test-classes	post-process the generated files from test compilation, for example to do bytecode enhancement on Java classes. For Maven 2.0.5 and above.
test	run tests using a suitable unit testing framework. These tests should not require the code be packaged or deployed.
prepare-package	perform any operations necessary to prepare a package before the actual packaging. This often results in an unpacked, processed version of the package. (Maven 2.1 and above)
package	take the compiled code and package it in its distributable format, such as a JAR.
pre-integration-test	perform actions required before integration tests are executed. This may involve things such as setting up the required environment.
integration-test	process and deploy the package if necessary into an environment where integration tests can be run.
post-integration-test	perform actions required after integration tests have been executed. This may including cleaning up the environment.
verify	run any checks to verify the package is valid and meets quality criteria.
install	install the package into the local repository, for use as a dependency in other projects locally.
deploy	done in an integration or release environment, copies the final package to the remote repository for sharing with other developers and projects.

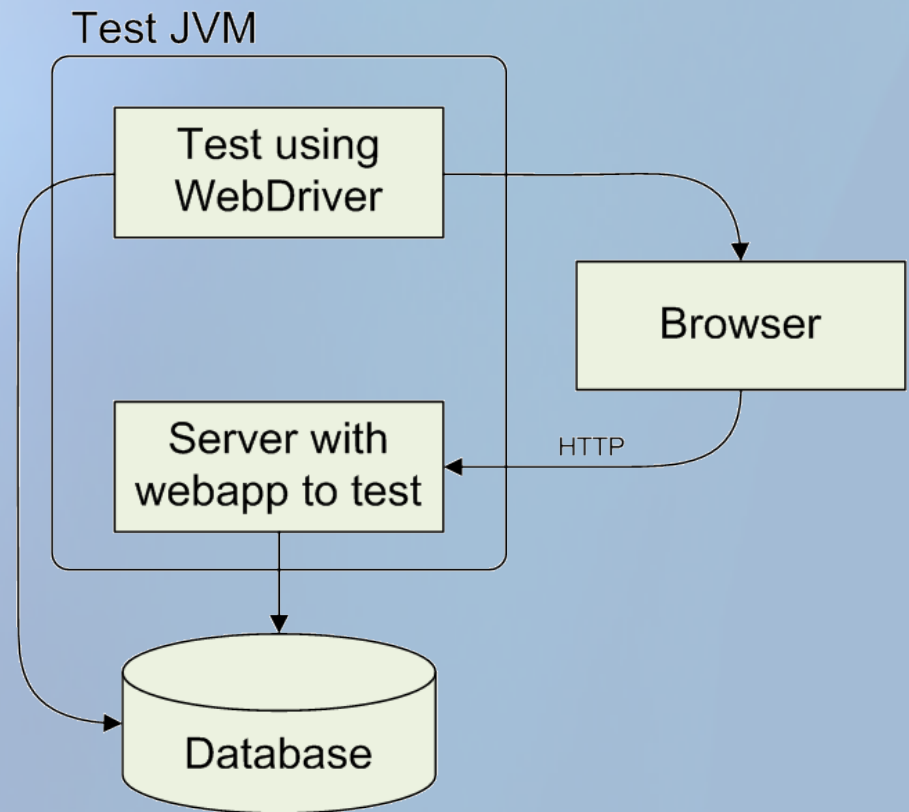

```

<!-- See http://maven.apache.org/plugins/maven-surefire-plugin -->

      </configuration>
      <goals>...</goals>
    </execution>
  </executions>
</plugin>

```

Testenvironment: Strategy 1

- Test sets up DB and starts server
 - Server runs in the same VM as the test, e.g. embedded Jetty or Tomcat
 - Overhead: Startup time of server and webapp

Testenvironment: Strategy 2

Best Practices

- Install the WebDriver Firefox Extension into your default Firefox profile and define the System property

```
webdriver.firefox.useExisting=true
```

- Now you can use  **Firebug** for debugging :)

Best Practices

- Make your tests as readable as possible:
Add a DSL like abstraction layer ...

Google Search Refactored

```
public class GoogleSearchRefactored extends AbstractWebDriverTest {  
  
    @Test  
    public void searchForJaxMichaelTamm() {  
        goTo(GOOGLE_HOMEPAGE);  
        enter("Jax Michael Tamm", into(inputField("q")));  
        clickOn(button("Google Search"));  
        assertThat(currentPage(), containsText("JAX 2008"));  
    }  
  
}
```

Actions

```
protected void goTo(EinstiegsSeite einsteigsSeite) {  
    _driver.get(einsteigsSeite.getUrl());  
}  
  
protected void enter(String value, WebElement inputField) {  
    inputField.sendKeys(value);  
}  
  
protected void clickOn(WebElement webElement) {  
    webElement.click();  
}
```

Finders

```
protected WebElement button(String label) {
    try {
        return _driver.findElement(By.xpath("//input[@type = 'submit' and @value = '" + label + "']"));
    } catch (NoSuchElementException e) {
        for (WebElement button : _driver.findElements(By.xpath("//button"))) {
            if (button.getText().equals(label)) {
                return button;
            }
        }
        throw e;
    }
}

protected WebElement inputField(String name) {
    return _driver.findElement(By.name(name));
}

protected WebElement link(String linkText) {
    return _driver.findElement(By.linkText(linkText));
}
```

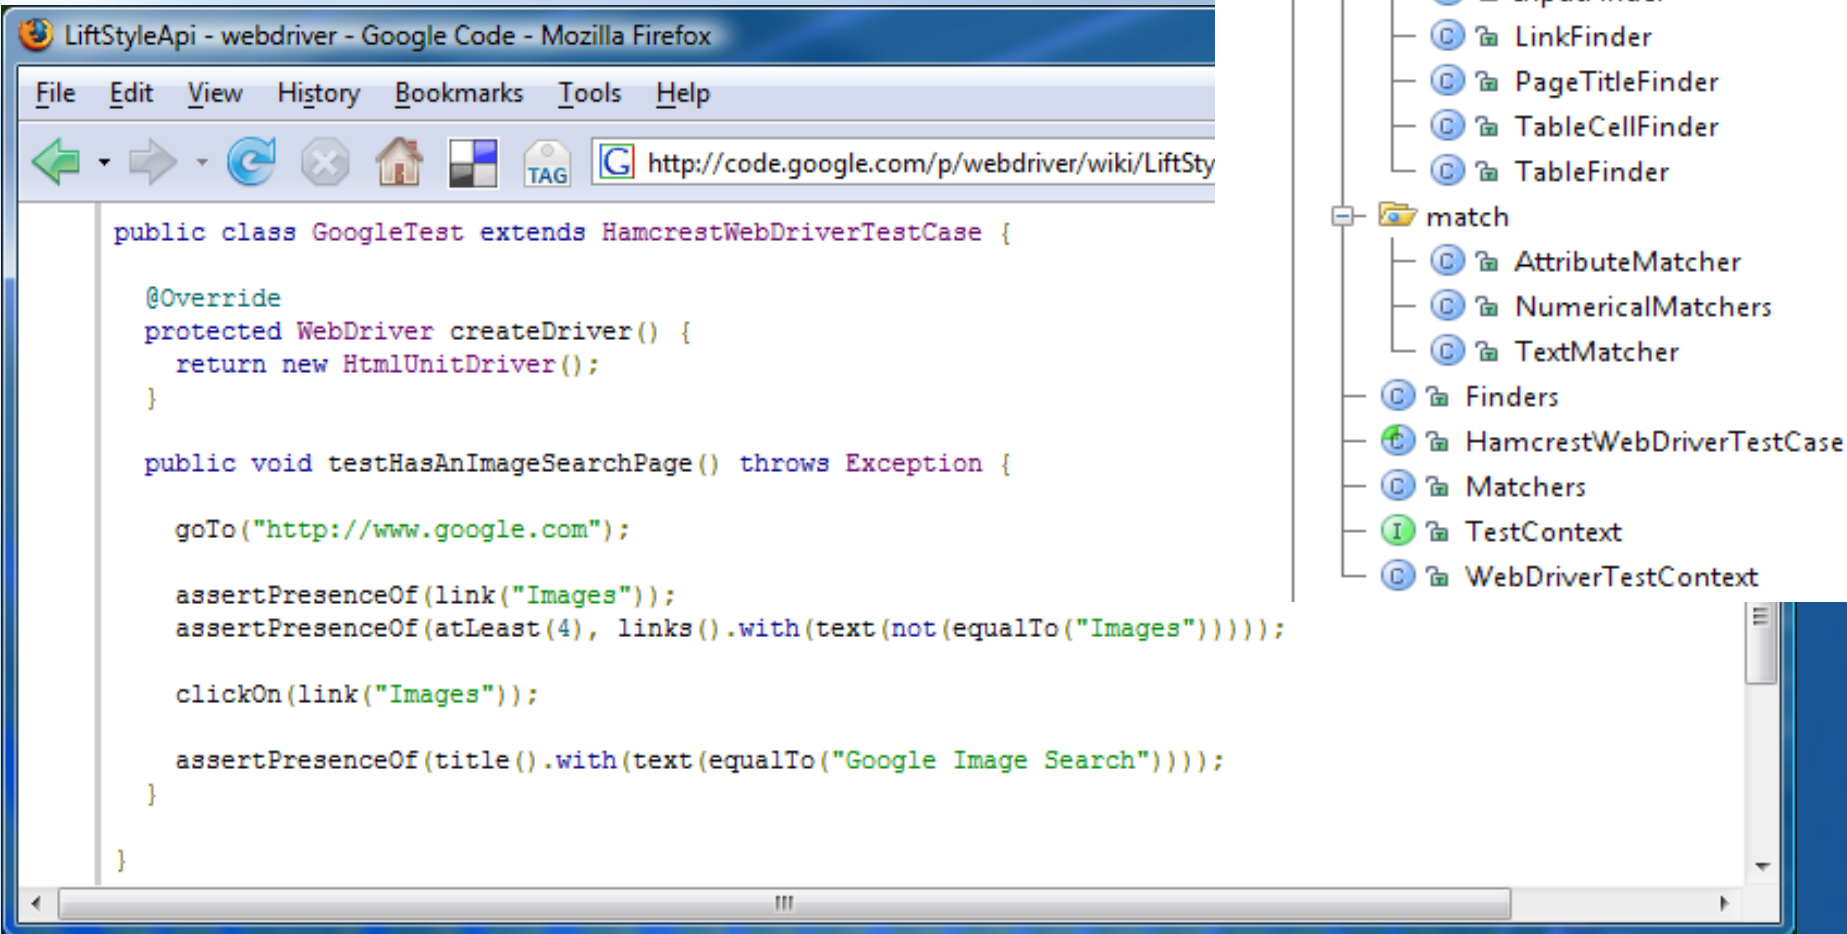

Matchers

```
protected Matcher<WebDriver> containsText(final String expectedText) {  
    return new TypeSafeMatcher<WebDriver>() {  
        public boolean matchesSafely(WebDriver driver) {  
            return driver.findElement(By.xpath("/html/body")).getText().contains(expectedText);  
        }  
  
        public void describeTo(Description description) {  
            description.appendText("a page containing \"" + expectedText + "\"");  
        }  
    };  
}
```

Example 3: Google Image Search

```
public class GoogleImageSearch extends AbstractWebDriverTest {  
  
    @Test  
    public void searchForMichaelTamm() {  
        goTo(GOOGLE_HOMEPAGE);  
        clickOn(link("Images"));  
        assertThat(currentPage().getTitle(), is("Google Image Search"));  
        enter("Michael Tamm", into(inputField("q")));  
        clickOn(button("Search Images"));  
        assertThat(currentPage(), containsText("Results 1 - 20"));  
    }  
}
```

WebDriver LiFT API

LiftStyleApi - webdriver - Google Code - Mozilla Firefox

File Edit View History Bookmarks Tools Help

<http://code.google.com/p/webdriver/wiki/LiftStyleApi>

```
public class GoogleTest extends HamcrestWebDriverTestCase {  
  
    @Override  
    protected WebDriver createDriver() {  
        return new HtmlUnitDriver();  
    }  
  
    public void testHasAnImageSearchPage() throws Exception {  
  
        goTo("http://www.google.com");  
  
        assertPresenceOf(link("Images"));  
        assertPresenceOf(atLeast(4), links().with(text(not(equalTo("Images")))));  
  
        clickOn(link("Images"));  
  
        assertPresenceOf(title().with(text(equalTo("Google Image Search"))));  
    }  
}
```

Best Practices

- Extract website specific HTML knowledge out of your tests and put it into your abstraction layer

Finders / Selectors / Locators

- By.id, By.name, By.linkText, By.xpath
- Bad XPATH: `//table[5]/tbody/tr/td[2]/div/a/b`
 - Ugly, unreadable, doesn't convey purpose
 - Breaks easily if the HTML structure changes
- „Good“ XPATH: `//div[@id = 'foo']//a`
- What if HTML structure changes?
 - How can you find out, what was selected before?
